

## **CLINICAL GUIDELINES FOR THE USE OF NSAIDs**

Education

[Smart Guidelines](#)

The guidelines for clinical practice are focused on the preferred approaches to medical problems exhibited by scientifically valid research. These are supported by well-organised clinical, double-blind, placebo-controlled and large-scale population studies, and their meta-analysis. The guidelines are intended for all physicians who address the subject, without regard to speciality training or interests. The physician must wisely choose the most suitable course for the individual patient and the variables concerning the moment of decision.
